A guide to using artificial intelligence in the public ...

Artificial intelligence (AI) is, at its core, the science of simulating human intelligence by machines. One definition is the branch of computer science that deals with the recreation of the human thought process. The focus is on making computers human-like, not making computers human. The goals of artificial intelligence usually fall under one of three categories: to build systems that think the same way that humans do; to complete a job successfully but not necessarily recreate human thought;

Artificial intelligence is the application of machine learning to build systems that simulate human thought processes. It includes several disciplines such as machine learning, knowledge discovery, natural language processing, vision, and human-computer interaction.

Artificial intelligence – IBM Developer

Self-aware AI, or artificial superintelligence (ASI), is defined as a machine with intelligence on par with human general intelligence and in principle capable of far surpassing human cognition by creating ever more intelligent versions of itself. Currently, however, we don't know enough about how the human brain is organized to build an artificial one that is as, or more, intelligent in a general sense.
