Assisted Reproductive Technologies Are Anti Woman

Assisted reproductive technology (ART) is an effective treatment option for couples and individuals with fertility problems. A number of key steps, including pituitary downregulation, controlled ovarian stimulation, final follicular maturation trigger, oocyte retrieval, fertilisation, embryo transfer and luteal support constitute a conventional ART cycle.

An overview of assisted reproductive technology procedures ...

Assisted reproductive technology includes medical procedures used primarily to address infertility. This subject involves procedures such as in vitro fertilization, intracytoplasmic sperm injection, cryopreservation of gametes or embryos, and/or the use of fertility medication. When used to address infertility, ART may also be referred to as fertility treatment. ART mainly belongs to the field of reproductive endocrinology and infertility. Some forms of ART may be used with regard to fertile cou

Although widely used, assisted reproductive technologies (ARTs) are associated with adverse perinatal outcomes. To elucidate their underlying causes, we have conducted a longitudinal analysis of placental development and fetal growth using a mouse model to investigate the effects of individual ART procedures: hormone stimulation, in vitro fertilization (IVF), embryo culture and embryo transfer.
