In the marine industry, this protection method is also used on steel piles, piers, jetties and ship hulls. Another common type of cathodic protection, known as galvanizing, is commonly used to protect steel members and structures. ~~The Basics of Cathodic Protection - Corrosionpedia~~

Cathodic Protection is an industrial technique for controlling metallic corrosion. Corrosion is an electro-chemical process that operates as an electrical circuit. Corrosion occurs in the Anode by oxidation and metal is lost, whereas in the cathode protection occurs by the reduction reaction. So in the cathodic protection technique, the concerned metal is

~~—What ...—~~

Cathodic protection is one of the most effective methods for preventing corrosion on a metal surface. Cathodic protection is commonly used to protect numerous structures against corrosion, such as ships, offshore floaters, subsea equipment, harbours, pipelines, tanks; basically all submerged or buried metal structures.

Cathodic protection has probably become the most widely used method for preventing the corrosion deterioration of metallic structures in contact with any forms of electrolytically conducting environments, i.e. environments containing enough ions to conduct electricity such as soils, seawater and basically all natural waters. Cathodic protection basically reduces the corrosion rate of a metallic structure by reducing its corrosion potential, bringing the metal closer to an immune state.

Types of Cathodic Protection. There are two basic types of cathodic protection: galvanic, and impressed current cathodic protection. Galvanic. Galvanic protection consists of applying a protective zinc coating to the steel to prevent rusting. The zinc corrodes in place of the encapsulated steel.

~~What Is Cathodic Protection and How Does It Work ...~~

The key difference between anodic and cathodic protection is that in anodic protection, the surface to be protected acts as the anode whereas, in cathodic protection, the surface to be protected acts as the cathode. Anodic and cathodic protection are two electrochemical processes we use to prevent surfaces from corrosion or rusting.

This week, will discuss how cathodic protection works and how it can be applied in practice to protect metallic structures. Firstly, we ' ll discuss some of the basic principles behind cathodic protection, and we will see how some of the concepts you have learned in the other units are applied in a cathodic protection scenario. Subsequently, we ' ll discuss some aspects related to the design of ...
