Major economic upheavals can have the sort of effect that Schumpeter foresaw 60 years ago as creative destruction. In science and technology, equivalent upheavals result from either scientific revolutions (as observed by Kuhn) or the introduction of what Christensen calls disruptive technologies. And in software engineering, there has been no technology more disruptive than outsourcing. That it should so quickly reach maturity and an unparalleled scale is truly remarkable; that it should now be called to demonstrate its sustainability in the current financial turmoil is the challenge that will prove whether and how it will endure. Early signs under even the bleak market conditions of the last 12 months are that it will firmly establish its role across the world of business. Outsourcing throws into sharp focus the entire software engineering lifecycle. Topics as diverse as requirements analysis, concurrency and model-checking need to find a composite working partnership in software engineering practice. This convergence arises from need, not dogma, and the solutions required are those that will have the right effect on the associated activities in the world of the application: e.g., reducing the time for a transaction or making the results of a complex analysis available in real-time. While the business of outsourcing continues to be studied, the engineering innovations that make it compelling are constantly changing. It is in this milieu that this series of conferences has placed itself.

Martin Wiener develops a model that comprises 29 critical success factors which are classified into four distinct groups: internal suitability, internal management, external suitability, and external management factors. He shows that the external management factors are particularly relevant for the successful implementation of an offshore software development project and that the perception of the individual critical success factors greatly depends on the company perspective.

This book constitutes the thoroughly refereed post-proceedings of the First International Conference on Software Engineering Approaches for Offshore and Outsourced Development, SEAFOOD 2007, Zurich, Switzerland, in February 2007. The 15 revised full papers constitute a balanced mix of academic and industrial aspects and address topical regions such as processes, education, country reports, evaluation and assessment, communication and distribution, as well as tools.

This book offers key insights into how to manage software development across international boundaries. It is based on a series of case studies looking at the relationships between firms from North America, the UK, Japan and Korea with Indian software houses. In these case studies, which have typically been compiled over a 3-4 year timespan, the authors analyse the multi-faceted challenges encountered in managing these Global Software Alliances (GSAs). These challenges range from the conflicts that managers face when dealing with distance, to the tensions of transferring knowledge across time and space, to issues in trying to establish universal standards in a context of constant change, and the problems of identity that developers and clients experience in having to deal with different organizations and countries. Throughout the book, the authors draw on their extensive research and experience to offer constructive advice on how to manage GSAs more effectively.

Nevertheless, as many firms have
