Equivalent equations are equations that have identical solutions. Thus, $3x + 3 = x + 13$, $3x = x + 10$, $2x = 10$, and $x = 5$. are equivalent equations, because 5 is the only solution of each of them. Notice in the equation $3x + 3 = x + 13$, the solution 5 is not evident by inspection but in the equation $x = 5$, the solution 5 is evident by inspection.

Section 4.8 D'Alembert solution of the wave equation. Note: 1 lecture, different from § 9.6 in , part of § 10.7 in . We have solved the wave equation by using Fourier series. But it is often more convenient to use the so-called d'Alembert solution to the wave equation 1 .While this solution can be derived using Fourier series as well, it is really an awkward use of those concepts.

An equation may be solved either numerically or symbolically. Solving an equation numerically means that only numbers are admitted as solutions. Solving an equation symbolically means that expressions can be used for representing the solutions.. For example, the equation $x + y = 2x - 1$ is solved for the unknown x by the expression $x = y + 1$, because substituting $y + 1$ for x in the equation ...
