Weibull++ (Version 7.1.4 and above) now offers a usage-based warranty feature in addition to its previously existing selection of warranty analysis data formats. This feature automates the analysis procedure described above, thereby facilitating a process that would be quite tedious otherwise, particularly when dealing with large warranty data sets.

Usage-Based Warranty Analysis - Reliability Engineering

In addition, information gathered using a Weibull Analysis allows the manufacturer to plan for any known costs or set the proper warranty terms. Weibull Analysis is an effective method of determining reliability characteristics and trends of a population using a relatively small sample size of field or laboratory test data.

Warranty Prediction Based on Failure Distribution Analysis Warranty returns provide a basis to determine the field use failure distribution. They provide feedback on quality performance and enable predictions regarding quality spill severity. The difficulty in predictions relates to how one accounts for all parts in service.

The Weibull distribution can also model a hazard function that is decreasing, increasing or constant, allowing it to describe any phase of an item's lifetime. The Weibull distribution may not work as effectively for product failures that are caused by chemical reactions or a degradation process like corrosion, which can occur with semiconductor failures.
